

Foxtails & Plant Foreign Bodies

Foxtail plants can be risky for your pet. The barbed seed heads of the foxtail plant can work their way into any part of your dog or cat, from the nose to between the toes and inside the ears, eyes, and mouth.

They can even simply dig themselves directly into a patch of skin.

The foxtail plant is a grass-like weed. It is mostly found in the Western half of the United States.

The danger of foxtails goes beyond simple irritation. Because these tough seeds don't break down inside the body, an embedded foxtail can lead to serious infection for your pet. It can even lead to death if left untreated. The seeds can be hard to find in your pet's fur.

So how can you tell if your pooch has a foxtail that's causing problems? If you find a foxtail should you extract it? And when is it time to call Adobe Animal Hospital?

Foxtails and Your Pet: Risks and Symptoms

Foxtails travel. Moving relentlessly forward, never back, they can migrate from inside your pet's nose to its brain. They can dig through skin or be inhaled into – and then perforate – a lung.

Embedded foxtails can cause discharge, abscesses, swelling, pain, and death. If your pet is displaying any of the following symptoms, check for foxtails or talk to your vet:

- **Feet.** Foxtails love your pet's feet and can easily become embedded between tender toes. Check for foxtails if you notice swelling or limping or if your pet is constantly licking the area.
- **Ears.** If your pet is shaking his head, tilting it to the side, or scratching incessantly at an ear, this could be the sign of a foxtail – one that may be so deep inside the ear canal you can't see it. Your veterinarian needs to take a look using a special scope.

- **Eyes** . Redness, discharge, swelling, squinting, and pawing all may be signs your pet has a foxtail lodged in its eye. If you think this may be the case, seek veterinary care immediately.
- **Nose**. If you see discharge from the nose, or if your pet is sneezing frequently and intensely, there may be a foxtail lodged in a nasal passage.
- **Genitals**. Foxtails can find their way into these areas, too. So if you notice your pet persistently licking at its genitals, foxtails could be the cause.

Tips for Preventing Foxtail Problems

Any dog or cat can get foxtails in the ears, nose, eyes, or mouth. But pets with long ears and curly hair can be especially prone to foxtail problems. Prevent issues by:

- Examining your pet's coat during foxtail season – generally May through December - especially if you've gone walking in open fields. Brush your pet as necessary, looking especially closely for pointy foxtail awns in your pet's thick or feathery fur.
- Check your pet's face and ears carefully for foxtails. Don't forget to look in and around your pet's mouth and gums.
- Carefully check your pet's paw pads for foxtails – especially between the toes.
- Use tweezers to remove any foxtails you can easily get to. But if a foxtail is deeply embedded, or if the area around it is red or swollen, call Adobe Animal Hospital right away. Remember, foxtails won't come out on their own, and they can burrow into the brain, spine, eardrums, lungs – actually, anywhere.

The easiest way to prevent foxtail problems is to keep your pet out of overgrown, grassy areas. You should also pull out any foxtail plants you find in your yard. Also consider trimming your pet's hair during foxtail season, especially if it tends to persistently get foxtails in one spot.
